

Flame Retardant Chemicals and Public Health: Fire Safety Without Harm

**Free Teleconference:
Wednesday, March 4, 2015
9:00 am – 10:00 am**

Extensive research has determined that **flame retardant chemicals** used in home furniture and baby products **do not improve fire safety**.

Mounting evidence also shows a link between exposure to flame retardant chemicals and:

- **Cancer**
- **Endocrine disruption**
- **Neurological impairments**
- **Reproductive harm**

Join us for a one-hour discussion with Dr. Arlene Blum, founder of the Green Science Policy Institute.

- Find out about the national health impacts of California's new furniture flammability standards to provide increased fire safety without the use of flame retardant chemicals.
- Learn how you can support legislation in Alaska to phase out harmful flame retardants from children's products and upholstered furniture.
